since its invention in 1962 the semiconductor laser has come a long way advances in material purity and epitaxial growth techniques have led to a variety of semiconductor lasers covering a wide wavelength range of 0 3 100 nm the development during the 1970s of gaas semiconductor lasers emitting in the near infrared region of 0.8-0.9 nm resulted in their use for the first generation of optical fiber communication systems however to take advantage of low losses in silica fibers occurring around 1.3 and 1.55 nm the emphasis soon shifted toward long wavelength semiconductor lasers the material system of choice in this wavelength range has been the quaternary alloy ingaasp during the last five years or so the intense development effort devoted to ingaasp lasers has resulted in a technology mature enough that lightwave transmission systems using ingaasp lasers are currently being deployed throughout the world this book is intended to provide a comprehensive account of long wavelength semiconductor lasers particular attention is paid to ingaasp lasers although we also consider semiconductor lasers

operating at longer wave lengths the objective is to provide an up to date understanding of semiconductor lasers while incorporating recent research results that are not yet available in the book form although InGaAsP lasers are often used as an example the basic concepts discussed in this text apply to all semiconductor lasers irrespective of their wavelengths

as each area of technology with a potential for significantly impacting any major segment of the electronics industry evolves it often is accompanied by the development of a succession of new circuits each new circuit indeed appears different employing different components in differing configurations and claims an assortment of distinct features of improved performance without a considerable investment of laboratory time to construct evaluate and compare each candidate circuit it usually is difficult to realistically appraise the relative merits of one approach over another it often is even more difficult to identify the underlying principles which point up basic similarities and differences such is the situation in the new and rapidly expanding area known as electronic power processing or switching mode power supplies the area of switching power supplies has been spurred by the need for power sources of higher performance smaller volume and lighter weight in order to achieve compatibility with the shrinking size of all forms of communication and data handling systems and particularly with the portable battery operated equipment in everything from home appliances and handtools to mobile communication equipment static DC to DC converters and DC to AC inverters provide a natural interface with the new direct energy sources such as solar cells fuel cells thermoelectric generators and the like and form the central ingredient in most uninterruptable power sources
